Environmental Science

# What is *Soil Health*?

The continued *capacity* of soil to **function** as a vital **living system**, within ecosystem and land-use boundaries, to *sustain* biological productivity, promote the *quality* of air and water environments, and maintain *plant, animal, and human health*

(Doran and Zeiss, 2000)

# Soil *Functions*

- ◆ Element **ycling**
- ◆ Store **Carbon** and **Water**
- ◆ Shelter **Biology**
- ◆ Gaseous exchange

# Soil Health Principles

*Soil Armor*

*Maintain Living Roots*

*Ecosystem Diversity*

**Boost Biology**

*Integrate Livestock*

*Minimize Soil Disturbance*

# Soil Health *Indicators*

**Organic Matter**

**Biology**

**Soil Structure**

**Soil Fertility**

**Water Movement**

**Erosion**

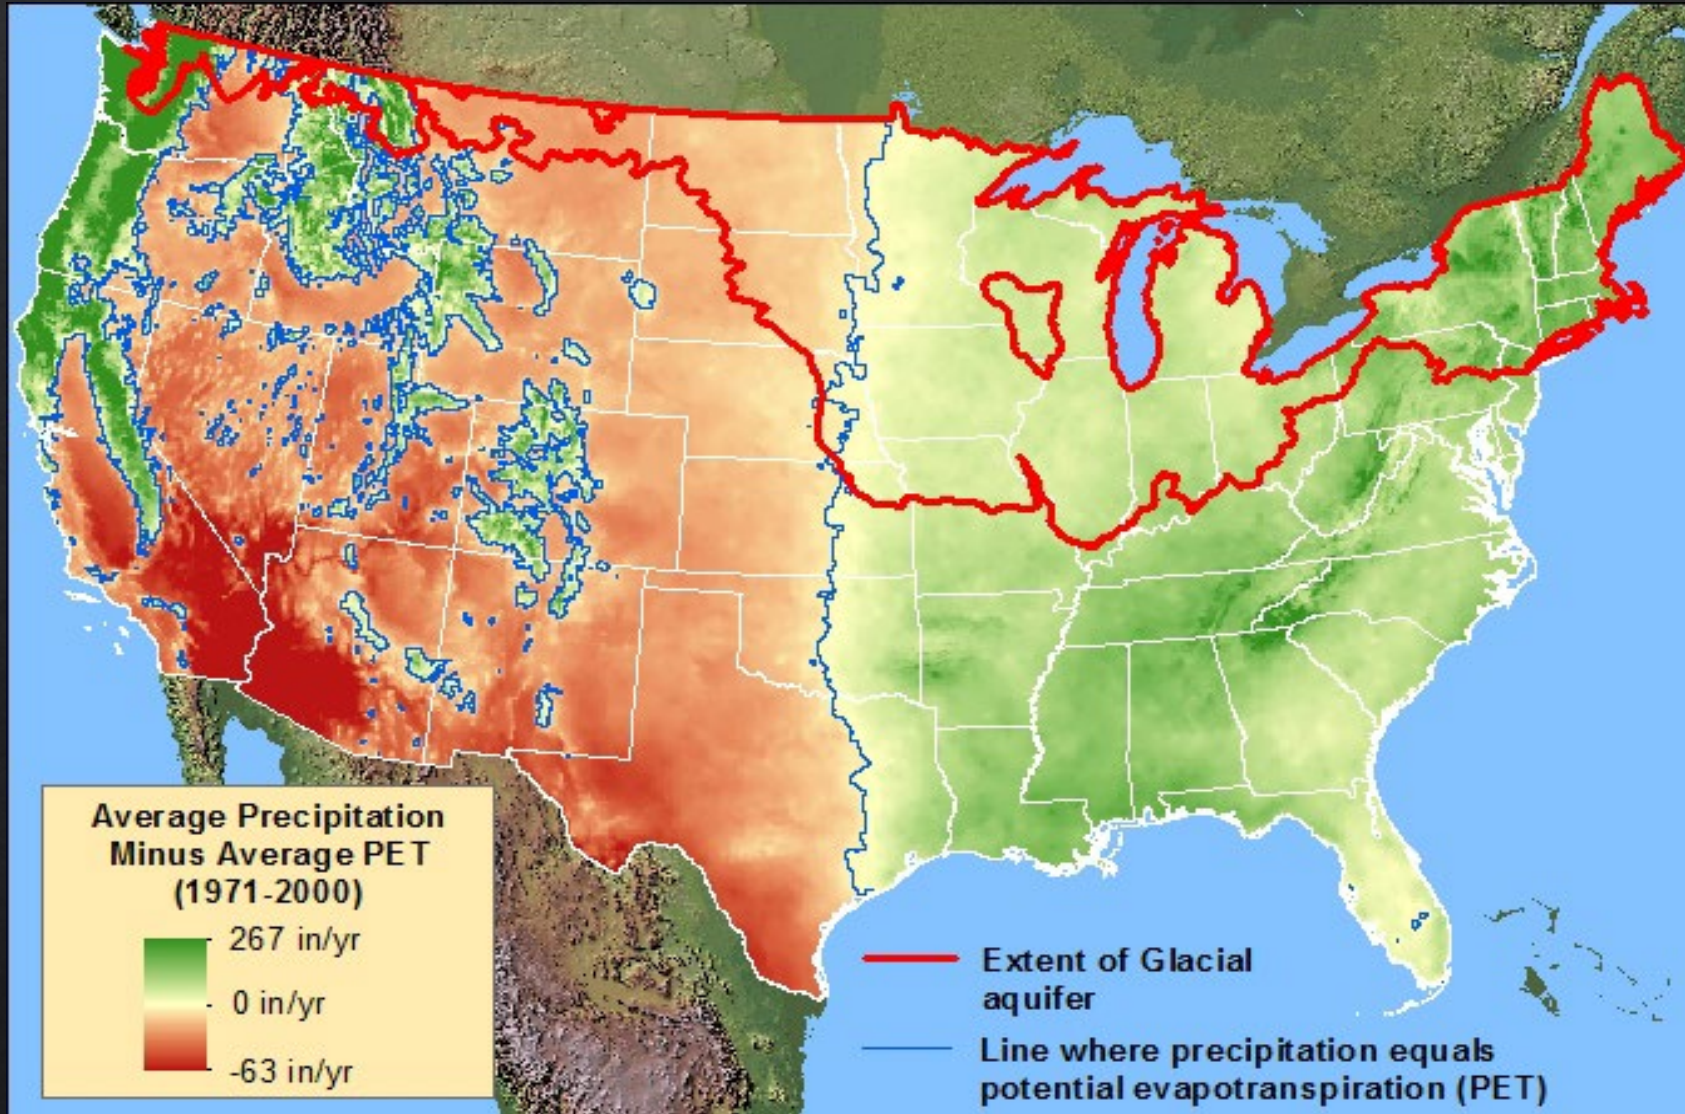

# Soil Health Barriers in Arizona

- ◆ **Water** scarcity
- ◆ **Salt**-affected soils
- ◆ Organic matter decomposition
- ◆ Survival of soil organisms

# Precipitation < Evapotranspiration

# SOM: Decomposition > Build-up

# Rangeland Soil Health: Why do we *care*?

- ◆ **Nutrient** Cycling: fertile rangelands
- ◆ **Water** Dynamics and Storage
- ◆ Physical Stability/ Porosity, soil **aggregation**
- ◆ **Resistance and Resilience** against extreme events
- ◆ **Biodiversity** and Habitat: plant and animal spp.
- ◆ Filtering and **Buffering** unwanted elements

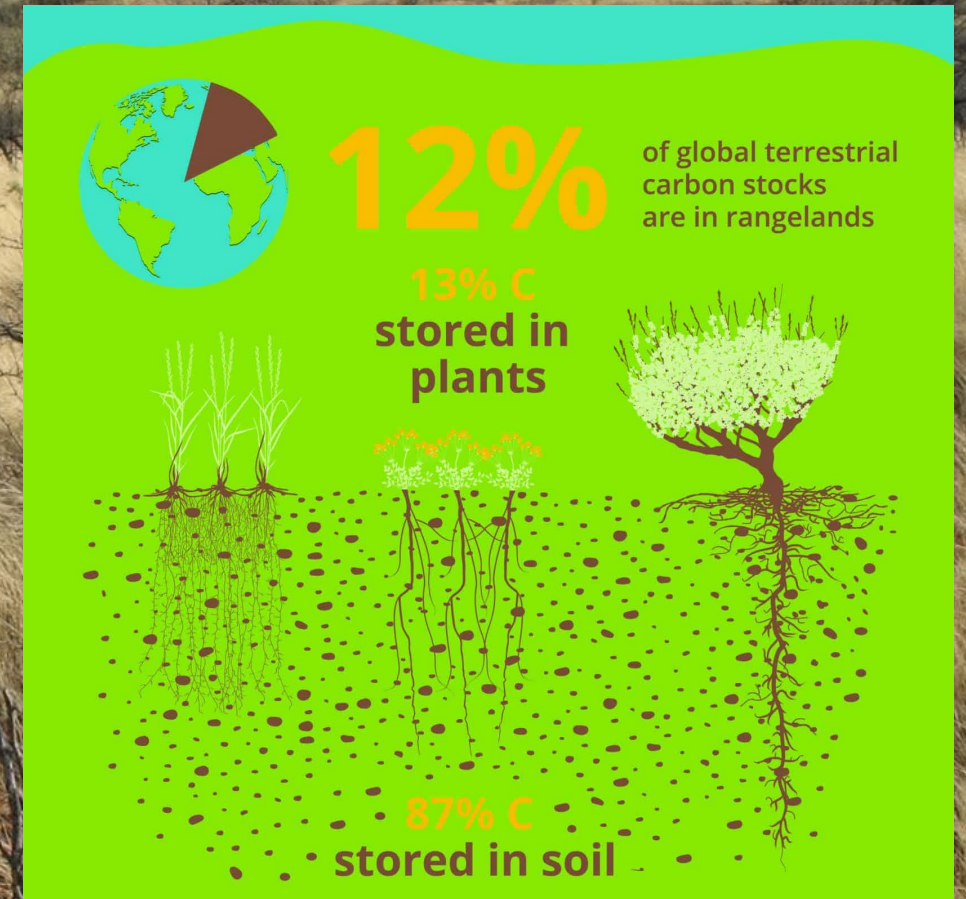

# Significance of Rangeland Management

- ◆ Rangelands are native habitats to hundreds of plant species, birds, reptiles, and insects
- ◆ Ranching industry: ~US \$8 billion
- ◆ A vast store of carbon, both in soils and vegetation
- ◆ Carbon sequestration: depends on appropriate management
- ◆ Minimizing degradation or desertification

# Rangeland Soil Management

- ◆ Sequester carbon
- ◆ Reverse soil carbon loss
- ◆ Regenerate **Soil Health**
- ◆ Sink for greenhouse gases

# Grazing and Soil Health: What we know

- ◆ Grazing increases soil compaction relative to no grazing
- ◆ Rotational grazing reduces compaction and increases soil carbon
- ◆ Rotational grazing could create climate change mitigation
- ◆ Reduced grazing intensity reduces compaction and increases C
- ◆ Soil texture and annual precipitation moderate grazing impacts

# Natural Laws of Grazing Management

- ◆ Keep down the shoot, kill the root
- ◆ Nature does not like bare spots
- ◆ Bare soils decrease moisture availability
- ◆ Nature brings back the best-adapted plants

# Keys to Grazing Management

- ◆ Stocking rate
- ◆ Livestock rotation
- ◆ Utilization rate/ Grazing intensity
- ◆ Plant rest and recovery

# Rangeland Seeding

- ◆ Alter rangeland **vegetation**
- ◆ Provide better **quality forage**
- ◆ **Seasonal balance** of quality forage
- ◆ Impart **biodiversity**
- ◆ Soil stability/water and carbon storage

# Rangeland Soil Health Indicators

| Soil health principle                | Qualitative rangeland assessment indicator   |
|--------------------------------------|--|
| Increase plant diversity             | Indicator 10–Plant community composition and distribution relative to infiltration and runoff<br>Indicator 12–Functional/structural groups<br>Indicator 13–Amount of plant mortality and decadence<br>Indicator 15–Annual production<br>Indicator 16–Invasive plants |
| Reduce soil disturbance              | Indicator 9–Soil surface loss or degradation<br>Indicator 8–Soil surface resistance to erosion<br>Indicator 11–Compaction layer  |
| Extend period of active plant growth | Indicator 4–Bare ground<br>Indicator 12–Functional/structural groups<br>Indicator 15–Annual production<br>Indicator 16–Invasive plants   |
| Maintain soil cover                  | Indicator 4–Bare ground<br>Indicator 14–Litter amount  |

# Assessment: Key Functions

- ❖ Soil Productivity
- ❖ Biodiversity
- ❖ Water properties
  - ❑ Infiltration
  - ❑ Water holding capacity
  - ❑ Aggregate stability

# Levels of Soil Health Assessment

## ◆ Level 1 – Observations:

- ❖ Amount of bare soil present, surface horizon depth, signs of erosion, soil structure and aggregation, soil texture, penetration resistance, salt accumulation and moisture content

## ◆ Level 2 - Field Tests:

- ❖ Bulk density, ponded infiltration, aggregate stability, soil pH, soil electroconductivity (EC), lime content, and plant-available nitrogen and phosphorus.

## ◆ Level 3 – Lab Tests:

- ❖ Soil health indicators such as soil organic matter (SOM) and carbon, plant available nutrients, active carbon, biologically available nitrogen, and soil salinity and sodicity

# Key Research Questions

- ◆ Evaluating the **effects of conservation practices** on soil health
- ◆ Identifying the “**early indicators**” of soil health changes
- ◆ Adopting management practices integrating **climate resiliency**
- ◆ How to **monitor** soil health

# Thank you!
